

A Guide to Lens Types

Select a lens type like one of the ones below to help address your lifestyle goals. Here are some special tints, filters, and coatings that may be available from your eye care provider.

Anti-Reflective Coating
Reduces reflective light by eliminating reflections from both sides of the lens, which can enhance comfort, reduce eye strain and improves the cosmetic appearance of your eyeglasses.¹

Blue Light Filtering
Reduces the amount of blue light that reaches the eye, which can help minimize digital eye strain and improve sleep quality by blocking or absorbing blue light and UV light from screens.²

Digital Single Vision Lenses
Improves single viewing distance across the entire surface of the lens by either diverging or converging light rays to correct for nearsightedness, farsightedness, and astigmatism.³

High-Index Lenses
Made of materials that bend light more efficiently than traditional glass or plastic lenses, making them thinner and lighter.⁴

Lens Color Tint
Designed to enhance contrast and reduce glare while also helping with color perception to improve visual comfort in bright light.⁵

Photochromic Lenses (Transitions®)
Changes color depending on the amount of UV or artificial light.⁶

Polarized Lenses
Reduces glare from surfaces such as water, snow, and glass. Can improve visual clarity and comfort.⁷

Polycarbonate Lenses
Thinner and lighter than regular plastic lenses and more impact-resistant. Ideal for sports and children's eyewear.⁴

Progressive Lenses
Corrects age-related farsightedness and provides a smooth transition from distance vision to near vision without the visible line found in bifocal lenses.⁸

Scratch-Resistant Coating
Protects eyeglass lenses from scratches and other damage caused by everyday wear and tear.⁹

Trifocal Lenses
Lenses that have three different lens powers for distance, intermediate and near vision.¹⁰

Trivex Lenses
Lenses that are lightweight, impact-resistant and provide sharp vision.¹¹

Ultraviolet Coating
Protects eyes from harmful UV rays.⁹
